

JAHAN MUHAMMAD FOR
CAR WASHING & CLEANING CO.

Billing Manager Client Workflow Guide

Customer subscriptions, recurring invoices,
payments, PDF sharing and billing alerts.

LIVE SOFTWARE

`jm-car-wash-app-production.up.railway.app`

Prepared for client review and employee training

1 PURPOSE AND BUSINESS VALUE

What this software does

JM Car Wash Billing Manager keeps customer, vehicle, plan, invoice and payment information in one place. It is designed for a car washing company managing hundreds of recurring customers without calling or messaging every customer individually to calculate payment details.

The main result

An employee enters a customer once. The software then tracks the agreed price and billing cycle, creates recurring invoices, highlights action required, generates a professional PDF and records payments.

End-to-end workflow

1**Add the customer**

Enter contact, vehicle, plan, agreed price and billing schedule.

2**Track the subscription**

The system calculates the next billing date and shows expiry alerts.

3**Generate the invoice**

Automatic billing creates due invoices; an employee can also generate one manually.

4**Review and share**

Open the invoice, confirm the amount and share its PDF through WhatsApp.

5**Record the result**

Mark it sent, paid or unspent; payment history and customer profile update.

FEATURE	HOW IT WORKS
Single source of truth	Customer and billing records are stored in PostgreSQL.
Customer-specific pricing	Each customer may have a different agreed amount, even on the same plan.
Flexible billing	Monthly, weekly, one-time and manual billing types are supported.
No paid WhatsApp API	The employee reviews and shares the PDF manually through WhatsApp.
Live access	The current system is hosted online and works from a modern browser.

The employee starts from the Overview

The left navigation opens Overview, Customers, Plans, Invoices, Payment history and Settings. Number badges show records or actions that need attention.

What the dashboard shows

- Active customers: customers currently using a plan.
- Monthly revenue: expected recurring revenue based on active subscriptions.
- Payment pending: invoices issued but not yet paid.
- Overdue: invoices whose due date has passed without payment.
- Invoices to send: customers whose invoices are ready for employee action.
- Plan breakdown: distribution of customers across available plans.

Recommended daily habit

Open Overview at the start of the workday. Handle red overdue alerts first, then invoices ready to send, and finally pending payments.

3 CUSTOMER MANAGEMENT

Add and maintain customers

The Customers section is the master directory. Employees can search by customer name, WhatsApp number or vehicle plate, then open the complete customer profile.

FEATURE	HOW IT WORKS
Customer details	Name, WhatsApp number and customer-since date.
Vehicle details	Plate, building, flat and parking information.
Subscription	Plan, agreed customer-specific price and start date.
Billing type	Monthly, weekly, one-time or manual.
Next billing date	The next service cycle; shown as Plan Expiry in the directory.
Archive	Removes inactive customers from the active list without deleting history.
Restore	Archived customers remain available under the Archived filter and can be restored.

Important data-entry rule

The Plan Start Date and Next Invoice Date must represent the customer's real agreement. For recurring plans, the system uses these dates to calculate every future cycle.

4

CUSTOMER 360 PROFILE

Complete history for one customer

Clicking a customer name opens a 360-degree profile. This is the fastest place to answer questions such as "How long has this person been a customer?", "Which invoices are paid?" and "What is still outstanding?"

FEATURE	HOW IT WORKS
Overview	Contact, vehicle, subscription, next billing date and latest invoice.
Invoices	Complete invoice history with issue date, due date, amount and status.
Payments	Recorded payments, dates, methods and references.
Activity	Important customer actions such as invoice generation, edits and payment updates.
Summary cards	Total invoiced, total paid, outstanding and overdue values.
Quick actions	Edit customer, open WhatsApp or generate the next invoice.

How billing cycles are calculated

A plan provides a default price, but the customer's agreed price is stored separately. This allows two customers on the Basic plan to pay different amounts.

FEATURE	HOW IT WORKS
Monthly	A new cycle starts on the same day each month. Example: 28 Jul to 27 Aug.
Weekly	A seven-day service period. Example: 01 Jul to 07 Jul.
One-time	A single invoice only; recurring billing stops afterward.
Manual	No automatic recurring invoice. The employee creates invoices when required.

Missed-cycle protection

If the software was offline or a customer's billing date was missed, the scheduler catches up in date order. It creates each missing billing cycle, avoids duplicates, marks past-due invoices overdue and advances the customer to the correct next billing date.

Example: Haroon

Plan starts 28 February. If the next pending cycle is 28 April and the current date is 28 July, the system reconciles April, May, June and July. If July already exists, it is reused instead of duplicated. The next billing date becomes 28 August.

Duplicate prevention

Only one invoice can exist for the same customer and billing-period start date. Repeated clicks therefore open the existing invoice instead of creating another invoice for that cycle.

Invoice statuses

FEATURE	HOW IT WORKS
Pending	Invoice exists but has not been confirmed as sent or paid.
Sent	Employee confirms that the invoice was delivered.
Paid	Payment was received and recorded.
Overdue	The due date passed while payment remained outstanding.

Professional invoice workflow

1

Open or generate

Use View PDF for a saved invoice or Generate Invoice for the next billing cycle.

2

Review

Confirm customer, amount, issue date, due date and service period.

3

Edit if required

Authorized staff can update description, amount or dates before sending.

4

Share PDF

Use the share action where supported, or download the PDF and attach it in WhatsApp.

5

Confirm delivery

After successful delivery, click Mark as sent.

Information printed on every invoice

- Company name, UAE address, mobile number and email.
- Customer name, WhatsApp number, vehicle and location details.
- Invoice number, issue date and payment due date.
- Service period showing exactly which week or month is being billed.
- Plan/service description, quantity and total amount in AED.

WhatsApp behavior

Browsers do not allow a website to silently attach a local PDF to WhatsApp. The employee shares or attaches the generated PDF and presses Send. This keeps the current version free from WhatsApp API charges.

7 INVOICE LIST, EDITS AND PAYMENTS

Track every billing record

Available invoice actions

FEATURE	HOW IT WORKS
View PDF	Opens the complete invoice preview for review and sharing.
Edit	Changes description, amount, issue date or due date with a revision reason.
Mark as sent	Records delivery status and time.
Mark as unsent	Reverses an accidental sent action and returns the invoice to pending.
Mark paid	Creates the payment record and removes the invoice from outstanding balances.

Payment history

When an invoice is marked paid, the payment appears in Payment History and the Customer 360 profile. Paid totals, outstanding balances and overdue amounts update automatically.

Status priority

If the newest invoice is paid but an older invoice is still overdue, the customer remains marked Payment overdue. This prevents old unpaid balances from being hidden.

Daily step-by-step routine

1

Open Overview

Check red alerts, expired plans, invoices ready to send and overdue payments.

2

Review urgent customers

Open the customer profile to understand full invoice and payment history.

3

Prepare invoices

Open each ready invoice and verify its service period and agreed amount.

4

Share through WhatsApp

Share/download the PDF, select the correct customer and send it.

5

Update delivery

Click Mark as sent only after confirming the message was delivered.

6

Record payments

When payment arrives, mark the matching invoice paid and add payment details.

7

Correct mistakes

Use Unsent for an accidental sent status or Edit Invoice for billing corrections.

Monthly control checklist

FEATURE	HOW IT WORKS
Customer data	Check new, archived and restored customer records.
Billing dates	Review expired or soon-to-expire plans.
Invoice exceptions	Investigate customers with missing or overdue cycles.
Payment matching	Confirm every received payment is linked to the correct invoice.
Settings	Confirm company contact and invoice prefix remain correct.

Best practice

Do not mark an invoice paid until money is actually received. Do not mark it sent until the PDF/message has been delivered. These two controls keep dashboard totals reliable.

System configuration

FEATURE	HOW IT WORKS
Company details	Name, UAE address, phone and email printed on invoices.
Invoice prefix	Controls the beginning of invoice numbers, for example JMCW.
Plans	Create, edit and deactivate reusable plan templates.
Database	PostgreSQL stores customer, invoice, payment and activity history.
Hosting	The live demo currently runs on Railway and requires an active hosting plan long-term.

Current Version 1.0 boundaries

- WhatsApp is employee-assisted: no paid Cloud API or automatic background delivery.
- Invoices are generated automatically: delivery still requires employee confirmation.
- Internet is required: the live application and cloud database are online services.
- User login/roles: should be added before giving access to multiple independent staff members if not already protected by the hosting environment.
- Backups and hosting: production use should include a paid database/hosting plan and an agreed backup policy.

Suggested Phase 2 options

Role-based login, automatic WhatsApp Cloud API delivery, bulk import from Excel, downloadable business reports, automated database backups and branded domain/email can be added when approved by the client.

Recommended demonstration sequence

1

Show Overview

Explain alerts, pending amounts and navigation.

2

Add a sample customer

Use a custom agreed price and monthly billing date.

3

Open Customer 360

Show subscription, invoice history, payments and activity.

4

Generate an invoice

Point out issue date, due date and service period.

5

Share the PDF

Demonstrate the employee-assisted WhatsApp process.

6

Mark it sent and paid

Show status and totals updating across the system.

7

Explain automation

Demonstrate monthly renewal, duplicate protection and missed-cycle recovery.

Acceptance checklist

FEATURE	HOW IT WORKS
Customer records	Client confirms required customer and vehicle fields.
Plan rules	Client confirms monthly, weekly, one-time and manual behavior.
Invoice layout	Client approves company details, service period and total format.
Payment workflow	Client approves sent, unsent, paid and overdue meanings.
Employee process	Staff can follow the daily procedure without developer assistance.
Production plan	Client approves hosting, backups, users and future WhatsApp automation scope.
